### Important

Read the manual carefully before using the cycle and save it for future use.

---

2014 MONARK EXERCISE AB, Vansbro, Sweden
Monark Exercise AB

Monark has 100 years’ experience of bicycle production. The Monark tradition has yielded know-how, experience, and a real feel for the product and quality. Since the early 1900s, Monark bikes have been living proof of precision, reliability, strength and service. Those are the reasons why we now are the world leader in ergometer bikes and the market leader in Scandinavia in transport bikes.

We manufacture, develop and market ergometers and exercise bikes, transport bikes and specialized bikes. Our largest customer groups are within health care, sports medicine, public authorities, industry and postal services.

For more information: http://www.monarkexercise.se
Thank you for choosing a test cycle from Monark!

Ideal position is important for a performance to reach its maximum and increases the potential for a perfect performance. The new setting options, along with an upgraded workload adjustment, make Monark’s renowned bike even better.

- RT2 is equipped with a newly developed manual workload control, the workload is controlled by a lever located on the handlebar
- RT2 can be calibrated, both mechanically and electronically
- RT2 has built-in pulse receiver in the display and can be used with a separate chest belt (optional) and some models have built-in pulse sensors in the handlebars at the seat

NOTE!

Use of the product may involve considerable physical stress. It is therefore recommended that people who are not accustomed to cardiovascular exercise or who do not feel completely healthy, should consult a physician for advice.
Product Information

Facts

NOTE! Before you start using the recumbent - remember to remove any transport protection and protective tape on the flywheel.

Technical details

- Length: 1900 mm (75"")
- Width: 680 mm (26 3/4"")
- Height (max at display): 1065 mm (42"")
- Height (max at display): 1000 mm (39 1/3"")
- Weight: 87 kg
- Weight flywheel: 20 kg
- Max user weight: 250 kg
- Painting: Industrial powder coating
- Rust protection: Zinc-based basic powder coating on exposed areas

Power output

- Continuous (50-100 rpm): 4-700 W
- Peak (at rpm): 1400 W (200 rpm)
- Smallest increment: 1 W

Recommended accessories

- Calibration weight, 2 and 4 kg
- Chest belt
- Power adaptor

Technical data power adaptor (accessory)

- Output voltage: +9 V DC
- Current: 500 mA
- Polarity: Minus (-) in the middle of connector. See Fig: Polarity.
  (Art. No. 9384-650, USA  Art. No: 9384-62)

Serial number

The serial number is located on machine plate (5) according to Fig: Overview.

Initial operation

RT2 is mechanically calibrated in the factory. The user may still want to check this. For the procedure, see section "Calibration".

If you use power adaptor (optional): First, connect the power adaptor to the power connector on the right side of the recumbent, see Fig: Overview. Then plug the power adaptor into the wall outlet.

Perform the electrical calibration as specified in section "Calibration". Test by pedalling the recumbent. If the recumbent works properly, it is ready for use.

Monark Exercise AB recommends that you check the mechanical calibration once a year to ensure the cycle’s accuracy.

Power on crank or flywheel

Monark bikes measure the effect of the flywheel, so it will be a friction of 6-8% if you measure the impact of the pedals (measure the effect of the crankshaft, the difference is 4-5 %). These percentages will be primarily due to friction in the chain, pedals and bearings.

RT2 is set to measure the workload at the flywheel. The bike can be set to work with effect in the pedals / crankshaft (the cycle constant).

Calories

There have been different theories on how to calculate this, since it depends on several factors and this means that it can only be seen as an estimate.

As a standard calculation, when we display calories on our calibrated bikes, we use: 1 minute with 100W gives 7 kcal. It is easy to convert watts to calories if it was on the flywheel, the formula is $1W=0,2388\times10^{-3}$ kcal/s with four decimals. But when you normally show calories you want to show the total amount of calories your body has used during your training, not only the calories "burnt" on the flywheel.

We have chosen the formula given above that we think complies with the results given for a standard cycle position.
1) Sprint for adjusting the seat-back tilt
2) Handle with pulse sensors (some models)
3) Lever for longitudinal adjustment seat
4) Handle with pulse sensors (some models)
5) Machine plate (serial number)
6) Workload lever
7) Display
8) Cable channel
9) Wire for workload control
10) Power input
**Bike adjustments**

**Adjustments of the recumbent**

- **Crank**: Steel, 52T, 170 mm standard, 172.5 mm optional
- **Pedals**: 9/16” with foot straps
- **Seat**: Recumbent seat
- **Handlebar**: Not adjustable recumbent handlebar
- **Distance seat - handlebar**: 80-470 mm (3” - 18½”)

**Recumbent adjustments**

When you ride on the recumbent you should adjust the distance to the pedals so that you get a comfortable seating position. You can adjust the seat longitudinally by lifting the lever on the right side and push the seat forward / backward. Once you find the correct position, release the lever and make sure it locks (a click is heard).

To change the seat-back tilt, pull out the sprint to the right and help with the other hand to change the tilt. Once you find the correct position, release the lever and make sure it locks (a click is heard). See Fig: Adjustments.

**Daily check**

The following procedure ensures that the recumbent works for daily use.

- Check the HR function if you use chest belt, see section, on 'Heart rate'.
- Check the braking force by putting on a certain workload and check that the load is applied.
- Test by pedalling and check that a reasonable rpm is obtained - verify by a clock. Feel if the pedals move smoothly. Listen for unusual sounds. Adjust if necessary.
- Adjust the seat and make sure it is securely attached and that the adjustment is working properly.
- Make sure the support legs are in position by rocking the bike. Tighten if necessary.

If something unusual is found during the daily inspection that you cannot resolve, please call customer service.
The user's heart rate can be measured with pulse sensors in the handles of the seat (some models) or with chest belt that detects your pulse from the heart.

Heart rate monitoring requires that the chest belt is correctly placed. Make sure that your skin is clean where the chest belt should be placed. When it is correctly fitted the logo on the belt will be central and readable, outward and upright, by another person. The chest belt should be secured at a comfortable tension around the mid section, just below the breast muscle, see Fig: Placement chest belt. Moisten the electrodes before use, see Fig: Electrodes on the back of the chest belt.

NOTE! Electromagnetic waves can interfere with the telemetry system. Cellular phones are not allowed to be used near the bike during test.

**Pulse standard (chest belts)**

The following pulse standard / chest belts can be used:

- Standard, uncoded 5K chest belts (5-5.6 kHz)
- Chest belts with ANT+

Short range ANT+: 0.6-0.8 m
Long range ANT+: 4-5 m
Range 5K: 0.8 m (31 ½”)

**Pairing display and chest belt**

Normally the display connects to the first ANT+ chest belt in "short range" and shows the heart rate until the chest belt is outside the "long range". If there is no ANT+ chest belt but a 5K chest belt in "short range", the heart rate from the 5K chest belt is displayed until the signal is lost.

ANT+ is prioritized and the first choice of the display. 5K is discriminated, but after 30 seconds with only 5K the display is locked to this chest belt as long as you do not lose the signal.

**Battery replacement pulse sensor (some models)**

The battery holder for pulse sensors in the seat handle is positioned at the front under the seat. Lift the cover by prying it in the intended slot. The batteries, 2x 1.5V size AA (R6), can then be easily replaced. Be sure to place the battery (+) - and (-) poles in the right order. See Fig: Battery replacement pulse sensor. Replace the cover.

---

Monark Exercise AB recommend that you use an ANT+ chest belt for best function.
Sleep mode

Sleep mode is activated after 10 minutes if you do not press any button or if no rpm is recorded. This is to save battery power.

All settings are saved, but the personal settings are erased (to protect your personal privacy).

The meter wakes up when you press any button or if rpm is recorded. The meter goes directly to ‘Quick start’ (see separate section).

Display Description

Batteries: 4 x 1.5 V, R14
Storing temperature: -10°C - +60°C
Operating temperature: 0°C - +50°C

NOTE! Rechargeable batteries cannot be used!

The meter has the following functions:

- Settings for different units of measurement
- It is possible to calibrate the meter to get the correct workload
- Personal data such as age, max pulse, weight and gender can be set
- USB port for continuous output of data to an external computer
- The meter also shows current pulse as percentage of max. HR
- The workload is rpm independent

Workload adjustment

The workload is adjusted by using the control lever (1) located on the handlebars. From A which is a light workload to F which is a heavy workload.

Fine adjustment of the workload is done by the cable adjuster (2). See Fig: Workload adjustment.
Personal settings

Usually you are asked to set the personal data needed when you start a program or a test. This data can also be set before, during e.g. "Warm up" in Training program with this function.

Set weight

Weight kg 75

Set gender

Gender Woman

Set age

Age 35

Set max HR

Max HR 185

The display returns to start view.

The settings are saved until the meter goes into sleep mode. When the display wakes up the personal settings are changed to default values (this is to protect your personal privacy).

Alternative power / force display

The meter displays power in watts (default). If you want to display the power in kpm / min instead, press the HEART button for 5 seconds. Then you can switch between WATT, KPM / MIN and current kp-value using the (+/-) button. Press ENTER or wait 10 seconds to confirm and exit the setting.

NOTE!

Even if you select kp as unit it is the power in watts as the value is calculated on.

The displayed kpm / min is a simplified calculation (1 kp = 10 N) according to Astrand's tables.

(Although the displayed kp value is correct and not rounded as above. For all calculations in the display the exact value is used, 1 kp = 9.80665 N)

Set units

Default (kg, km, km/h, ml/ min/kg)

You can switch between these different power values.

When the loading value you want appears, press ENTER to confirm.

NOTE!

When you press the HEART button the meter starts searching for a HR signal.
User settings

Here you can make individual adjustments to optimize the bike for your needs on first use and when needed.

Press ENTER and PROGRAM for 5 seconds to set 'User settings'.

Set units

Press ENTER and PROGRAM for 5 seconds to set 'User settings'.

Set cycle constant

ConStAnt 1.00

Set metronome cadence

CAAdEnCE 60

Set cycle-ID

Id00

The display returns to start view.

If START STOP is pressed, or if no button is pressed for 20 seconds (in all steps), the changes are saved and the display returns to normal with the new settings active.

Units

Kg, km, km / h, ml / min / kg are default. You can switch between the different unit combinations with (+/-) button.

- Kg, km, km / h, ml / min / kg (default)
- Kg, km, km / h, METS
- Lbs, miles, miles / h, ml / min / kg
- Lbs, miles, miles / h, METS

Cycle constant

The cycle constant is as default set to 1.00. Change using the (+/-) button.

When the cycle constant is set to 1.00 the power is measured at the flywheel. This is used in Astrand test, YMCA etc.

When the cycle constant is set to 1.05 the power is measured at the crank. This is often used on electronically-braked bikes.

Metronome cadence

Metronome diodes show pedalling revolutions (rpm) relative to the set reference value. The metronome is located at the back of the meter. The default value is 60 and can be adjusted with (+/-) button. The green LED in the middle flashes twice for each pedal revolution which helps to keep the right pedal cadence, see Fig: Display and Fig: Metronome.

The meter can be rotated so that the rider does not see the values in the display, but only sees the flashing diodes (in order to keep the right pedal cadence).

BikeID

This ID is a parameter that the PC software can ask for. It is used to identify or number bikes when multiple bikes are controlled by same PC or similar.
Calibration can only be done from the display!

To perform the calibration, you must have a 2 kg and a 4 kg calibration weight. These are available as accessories.

- Set the workload lever to minimum load
- Remove the cover over the flywheel
- Press the pressure roller and remove the wire from the black pulley (below the potentiometer) so that the pressure arm goes up completely and loosen the brake belt, see Fig: Workload unit.

Press START STOP and PROGRAM for 2 seconds to enter calibration mode.

Check the potentiometer value at 0 kp. It requires not be the same as shown in the picture, as it only shall be seen as an example.

Hang a 2 kg calibration weight in the spring hook.

Hang a 4 kg calibration weight in the spring hook.

Hang a 6 kg (or 2 + 4 kg) calibration weight in the spring hook.

Two short beeps are heard and the calibration is finished.

Lift off the weights, reassemble the wire and put on the cover.

The bike is ready to use.

If you have started the calibration mode but change your mind, you can press the START STOP button to exit without saving. (However, if you press ENTER the calibration process has begun and must also be completed.)

For best flexibility we recommend a potentiometer value between 40 and 60 at 0 kp.

Error message:
CallErr - if the value is outside the window.

Monark Exercise AB recommends that you check the mechanical calibration once a year to ensure the cycle’s accuracy.
Training

Personal data can be set for estimated HR (default HR is 185). See "Personal settings".

QUICK START

'Quick start' can be used as a separate program. (If START STOP is pressed, the TRAINING program is activated.) The program is active and starts with base power, adjust with the control lever. No time is counted so the test person can warm up, use it as a 'quick start' or train without logging any values.

TRAINING

Press START STOP in 'Quick Start' and the display begins to show, count and log values. Press START STOP again and the test is completed and the results are displayed on three pages in the display and you can switch between the pages by pressing (+/-)-button.

Workload adjustment

The workload is adjusted by using the control lever (1) located on the handlebars. From A which is a light workload to F which is a heavy workload.
During the test METS and l/min are continuously counted and displayed.

**Calculation**

METS values are displayed and calculated from the current workload. The two VO$_2$ values displayed during the test continuously calculate the average value for 5 seconds.

The formula used (values from ASTRAND original table) to calculate VO$_2$ at different workloads is:

$$0.2333 \ldots \ l / kpm = 0.01428 \ L / W \ (2.8 \ l / \ min \ at \ 1200 \ kpm)$$

This is according to Astrand’s table between 150 W and 300 W, and a good approximation for 15-700 W and a cadence of about 50-65 rpm.

# Troubleshooting guide

<table>
<thead>
<tr>
<th>Symptoms</th>
<th>Probable Cause / Corrective Action</th>
</tr>
</thead>
<tbody>
<tr>
<td>Display does not light up</td>
<td>• No batteries in the meter&lt;br&gt;• No current in the outlet (if power adaptor is used). Check the fuses.&lt;br&gt;• Check cables and connections.&lt;br&gt;• Correct power adaptor? Check that the transformer information (voltage, current, polarity, AC / DC) in section &quot;Facts&quot; complies with the transformer which is used.</td>
</tr>
<tr>
<td>No workload</td>
<td>• Check calibration.&lt;br&gt;• Check that brake belt is hooked in the spring.</td>
</tr>
<tr>
<td>No heart rate displayed</td>
<td>• Check that the battery is alright in the chest belt, moisten your thumbs and click on the electrodes, a low clicking sound will be heard at the battery cover, alternatively that the heart rate is displayed in the computer software.&lt;br&gt;• Make sure the belt fits correctly on the test person, see Fig: Placement of chest belt in section &quot;Heart Rate&quot;, and that the strap is sufficiently tightened. Moisten the electrodes, in severe cases it may be necessary to use gel alternative, one drop of dish washing liquid mixed in water. Pulse signal strength varies from person to person. Try the belt with a person known to have a good pulse wearing a chest belt.&lt;br&gt;• Make sure there are no loose cables. Use another HR receiver (HR watch or test bike monitor) to check the chest belt.</td>
</tr>
<tr>
<td>Irregular heart rate</td>
<td>• Use an external unit, for example a HR watch, to check if it also indicates an irregular pulse. If this is the case, there is probably disturbance in the room. The disturbance may be electronic fields from power cables, elevators, lamps etc. or other electronic devices which are too close (e.g. cell phones). Move the bike to a different location in the room or change rooms. If an irregular HR remains it should be checked manually. If the HR remains irregular at work the person’s health should be examined.</td>
</tr>
<tr>
<td>No rpm reading</td>
<td>• Check cable.</td>
</tr>
<tr>
<td>Unable to calibrate force</td>
<td>• The potentiometer shaft is not attached to the pendulum shaft, tighten the screw.&lt;br&gt;• The potentiometer is misadjusted.</td>
</tr>
<tr>
<td>There is a click noise when pedalling (increases with the weight)</td>
<td>• The pedals are not tight. Tighten them or change pedals.&lt;br&gt;• The crank is loose. Check, tighten.&lt;br&gt;• The base bearing is loose. Contact your dealer for service.</td>
</tr>
<tr>
<td>Scratching sound is heard when pedalling</td>
<td>• Check that the carriage block is taken off and that nothing is against the crank, chain, or wheel except the brake belt.</td>
</tr>
<tr>
<td>There’s a click noise and a squeak noise when pedalling</td>
<td>• Loosen the chain.</td>
</tr>
</tbody>
</table>
Service

Note that the text about service and maintenance is universal and that all parts may not be relevant to your bike.

Warning

Make sure the voltage indicated on the appliance corresponds to the local mains voltage before making connections.

Warranty

EU countries - Private use

If you are a consumer living in the EU you will have a minimum level of protection against defects in accordance with EC Directive 1999/44/EC. In short, the directive states that your Monark dealer will be liable for any defects, which existed at the time of delivery. In case of defects, you will be entitled to have the defect remedied within a reasonable time, free of charge, by repair or replacement.

EU countries - Professional use

Monark Exercise products and parts are guaranteed against defects in materials and workmanship for a period of one year from the initial date of purchase of the unit. In the event of a defect in material or workmanship during that period, Monark Exercise will repair or replace the product. Monark Exercise will not, however, refund costs for labour or shipping.

Other countries

Monark Exercise products and parts are guaranteed against defects in materials and workmanship for a period of one year from the initial date of purchase of the unit. In the event of a defect in material or workmanship during that period above, Monark Exercise will repair or replace (at its option) the product. Monark Exercise will not, however, refund costs for labour or shipping.

Service check and Maintenance

It is important to carry out a regular service on your ergometer, to ensure it is kept in good condition.

Always keep the bike clean and well lubricated.

Service action:

- We recommend isopropyl alcohol to disinfect the surface of the bike. Use a damp, but not wet cloth to clean the surface you wish to disinfect.
- Surface treatment with a rust inhibitor, especially when the bike is clean and the surfaces are dry. This is done to protect the chrome and zinc parts as well as the painted parts (4 times per year).
- Check now and then that both pedals are firmly tightened. If not the threading in the pedal arms will be damaged. When the ergometer is new it is important to tighten the pedals after 5 hours of pedalling (check this 4 times per year).
- Check the pedal crank is secure to the crank axle (4 times per year).
- Be sure that the pedals are moving smoothly, and that the pedal axle is clear of dirt and fibres (4 times per year).
- When cleaning and lubricating be sure to check that all screws and nuts are properly tightened (twice a year).
- Check that the chain is snug and there is no play in the pedal crank (twice a year).
- Check that pedals, chain and freewheel sprocket are lubricated (twice a year).
- Be sure that the brake belt does not show significant signs of wear (twice a year).
- Check that the handlebars and seat adjustment screws are lubricated (2 times per year).
- Be sure that all moving parts, crank and flywheel are working normally and that no abnormal play or sound exists. Play in bearings causes fast wearing and with that follows a highly reduced lifetime.
- Check that the flywheel is placed in the center and with plane rotation.
- Grind the brake belt contact surface, see section "Brake belt contact surface" (once a year).
Batteries

If the display is battery-operated, the batteries are in a separate package at delivery. If the storing time has been long the battery power can be too low to make the computer act correctly. Batteries must then be changed.

Flywheel bearing

The flywheel bearing is long-term greased and requires no supplementary lubrication. If a problem arises, please contact your Monark dealer.

Crank bearing

The crank bearing is greased and normally requires no supplementary lubrication. If a problem arises, please contact your Monark dealer.

Transportation

During transport the brake cord should be tightened to prevent it from falling off the flywheel.

Replacement of brake belt

To replace the brake belt remove covers if necessary. Make sure that the belt is loose.

Pendulum bike with engine:
To loosen the brake belt on pendulum bikes with engine, connect power to the unit and raise the pendulum to 4 kp. Hold it there until brake belt is loose. Please note how the belt is assembled. Remove it from the bike. Attach the new brake belt and assemble the bike in reverse order.

Weight basket bike:
To loosen the brake cord on cycles with a weight basket set the basket to its upper position. Loosen the lock washer that is holding the cord and remove it from the tension center. Loosen or cut off the knot on the other end of the cord and then remove the whole cord from the bike. When assembling a new brake cord, first enter one end into the hole in the tension center, and tie a knot and let the knot fall into the bigger part of the hole. Lock the end of the cord with the lock washer.

Manual pendulum bike / exercise bike:
To loosen the brake belt on the bike remove all tension. Please note how the belt is assembled. Remove it from the bike. Attach the new brake belt and assemble the bike in reverse order.

NOTE!
When replacing the brake belt it is recommended to clean the brake surface. See "Brake belt contact surface”.

Brake belt contact surface

Deposits of dirt on the brake belt and on the contact surface may cause the unit to operate unevenly and will also wear down the brake belt. The contact surface of the flywheel should be smoothed with fine sandpaper and any dust removed with a clean dry cloth.

Remove any potential covers and all workload on the brake belt and then remove it. Grind with a fine sand paper. Grinding is easier to perform if a second individual cautiously and carefully peddles the cycle.

Irregularities on the brake belt contact surface are removed by means of a fine sand paper or an abrasive cloth. Otherwise unnecessary wear on the brake belt may occur and the unit can become noisy.

Always keep the brake belt contact surface clean and dry. No lubricant should be used. We recommend replacing the brake belt when cleaning the contact surface. In regard to assembly and adjustment of the brake belt, see "Replacement of brake belt”.

![Fig: Brake belt contact surface](image-url)
Chain 1/2" x 1/8"

Check the lubrication and tension of the chain at regular intervals. In the middle of its free length the chain should have a minimum play (3) of 10 mm (1/4 inch). See Fig: Chain adjustments. When the play in the chain is about 20 mm (3/4 inch) the chain must be tightened. Otherwise it will cause abnormal wear of the chain and sprockets. Therefore it is always recommended to keep the chain play as small as possible. Loosen the hub nut (2) on both sides and tense the chain with the chain adjuster (1) when needed.

When the chain has become so long that it can no longer be tightened with the chain adjusters it is worn out and should be replaced with a new one.

To adjust or replace the chain, remove covers if required.

To adjust the chain the hub nuts (2) should be loosened. Loosening or tightening the nuts on the chain adjusters (1) will then move the hub and axle forward or backward. Then tighten the nuts on the hub axle again. See Fig: Chain adjustments.

To replace the chain, loosen the chain adjusters as much as possible. Dismantle the chain lock (6) and remove the chain. Use pliers to both release the lock washer and mount it again (4). Put on a new chain and assemble the chain lock. The spring of the chain lock should be assembled with the closed end in the movement direction (5) of the chain. See Fig: Chain replacement.

NOTE!
At assembly the flywheel has to be parallel with the centerline of the frame. Otherwise the chain and sprockets make a lot of noise and wear out rapidly.

Then assemble the removed parts as above but in reverse order.
Freewheel sprocket

When replacing the freewheel sprocket remove frame covers if necessary. Remove the chain according to section "Chain 1/2” x 1/8””.

Loosen the axle nuts and lift off the flywheel. Remove the axle nut, washer, chain adjuster and spacer on the freewheel side. Replace sprocket-adaptor and assemble the new parts in reverse order according to the above.

NOTE!
Do not tighten the axle nut completely. It must be possible to loosen the adaptor-sprocket half a turn.

The sprocket should be lubricated with a few drops of oil once a year. Tilt the cycle to make it easier for the oil to reach the bearing. See Fig: Lubrication.
